Synopsis

- Bimekizumab (BKZ), a monoclonal IgG1 antibody that selectively inhibits interleukin (IL)-17F in addition to IL-17A, has shown efficacy and tolerability in patients with active psoriatic arthritis (PsA) for 52 weeks in two Phase 3 trials: BE OPTIMAL1 (NCT03895203) and BE COMPLETE2 (NCT03896581).
- Guselkumab (GUS), an IL-23 inhibitor, has demonstrated 48 to 52-week efficacy and safety in patients with PsA in the DISCOVER 2 (NCT03158285)³ and COSMOS (NCT03796858)⁴ Phase 3 trials.
- Due to the absence of direct comparison trials or control arms to compare the efficacy of BKZ and GUS in PsA, a matching-adjusted indirect comparison (MAIC) was conducted to evaluate the relative efficacy of BKZ 160 mg every 4 weeks (Q4W) compared to GUS 100 mg Q4W or Q8W at 52 weeks in bio-n and tumor necrosis factor inhibitor-experienced (TNFi-exp) (Q8W only) patients with PsA.
- The EMA label for GUS recommends the Q4W dose for patients at higher risk of joint damage.⁵

Objective

To assess the 52-week comparative efficacy of BKZ 160 mg Q4W vs GUS 100 mg Q4/8W in patients with PsA who are biologic disease-modifying anti-rheumatic drug-naïve (bio-n) or TNFi-exp.

Methods

- Relevant trials were identified as part of a systematic literature review.⁶
- The MAIC method was followed in accordance with Signorovitch et al.⁷ and the National Institute for Health and Care Excellence Decision Support Unit Technical Support Document 18 (NICE DSU TSD 18).⁸
- Figure 1 shows how individual patient data (IPD) from BKZ trials were matched to GUS trials.
- BKZ trial patients were reweighted to match the baseline characteristics (Table 1) of the GUS trial patients; weights were determined using a logistic regression based on sex, age, methotrexate use (MTX), Health Assessment Questionnaire-Disability Index (HAQ-DI), proportion of patients with psoriasis affecting $\geq 3\%$ body surface area (BSA $\geq 3\%$), swollen and tender joint counts (SJC/TJC), and time since PsA diagnosis. The adjustment variables were selected based on expert consensus (n=5).
- Recalculated BKZ 52-week outcomes for American College of Rheumatology (ACR) 20/50/70 and minimal disease activity (MDA) index (non-responder imputation [NRI]) were compared to GUS outcomes via non-placebo-adjusted comparisons and were reported as odds ratios (ORs). The likelihood of outcome (e.g., greater or worse) was determined by the exclusion of value 1 from the 95% CIs. All analyses were conducted with R version 3.6.2 using the program provided in the NICE DSU TSD 18.

Results

- In bio-n patients, the post-matching effective sample sizes (ESSs) for BKZ were 155 (36% of original sample size [OSS]) and 142 (33% of OSS) for the comparisons to GUS Q4W and Q8W, respectively (Figure 2 A–B and Figure 3 A–B).
- BKZ had a greater likelihood of achieving ACR50, ACR70 and MDA outcomes than GUS Q4W at 52 weeks.
- BKZ had a greater likelihood of achieving ACR70 and MDA outcomes than GUS Q8W at 52 weeks.
- In TNFi-exp patients, the post-matching ESS for BKZ was 181 (68% of OSS) for comparison to GUS Q8W (Figure 2C and Figure 3C).
- BKZ had a greater likelihood of achieving ACR20, ACR50, ACR70, and MDA outcomes than GUS Q8W at 52 weeks.
- The MAIC-adjusted ORs did not differ greatly to the unadjusted ORs for any outcome.

Conclusions

Using MAIC methodology, bio-n patients treated with BKZ had a higher probability of achieving higher treatment thresholds (ACR70 and MDA) compared to GUS Q4W and Q8W.

TNFi-exp patients treated with BKZ had a higher probability of achieving all ACR and MDA responses compared to those receiving GUS Q8W.

The MAIC findings at 52 weeks are consistent with a recent NMA suggesting better efficacy of BKZ against GUS on joint outcomes at 16 to 24 weeks.

Figure 1 Summary of MAIC method

- MAICs use IPD from trials of one treatment to match baseline aggregate statistics reported from trials of another treatment.
- By using an approach similar to propensity score weighting, treatment outcomes can be compared across balanced trial populations after matching.

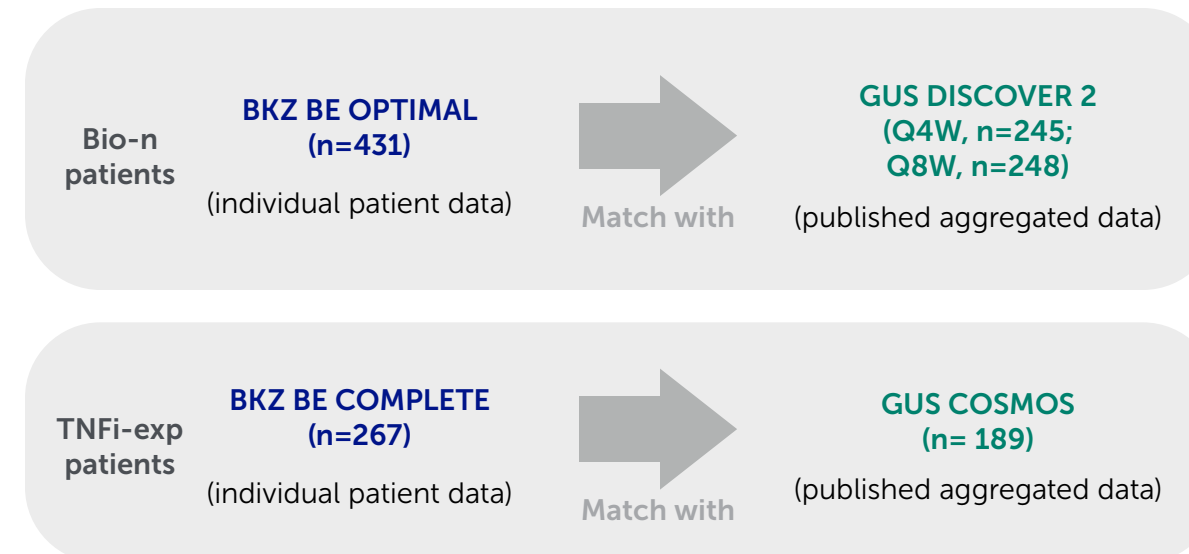

Table 1 Patient baseline characteristics before matching

| Mean (SD) unless stated | Bio-n | | | TNFi-exp | |
|-----------------------------|------------------|----------------------|----------------------|-------------------|------------------|
| | BE OPTIMAL N=431 | DISCOVER 2 Q4W N=245 | DISCOVER 2 Q8W N=248 | BE COMPLETE N=267 | COSMOS Q8W N=189 |
| Age, years | 49 (13) | 46 (12) | 45 (12) | 50 (12) | 49 (12) |
| Male, % | 47 | 58 | 52 | 49 | 46 |
| Time since diagnosis, years | 6.0 (7.3) | 5.5 (5.9) | 5.1 (5.5) | 9.6 (9.9) | 8.3 (7.8) |
| MTX use, % | 59 | 69 | 69 | 45 | Not reported |
| SJC (of 66 joints) | 9.0 (6.2) | 12.9 (7.8) | 11.7 (6.8) | 9.7 (7.5) | 10.0 (7.0) |
| TJC (of 68 joints) | 16.8 (11.8) | 22.4 (13.5) | 19.8 (11.9) | 18.4 (13.5) | 21.0 (13.0) |
| HAQ-DI score | 0.82 (0.59) | 1.2 (0.6) | 1.3 (0.6) | 0.97 (0.59) | 1.3 (0.6) |
| BSA $\geq 3\%$, % | 50 | 75 | 71 | 66 | 70 |

*Only 48-week efficacy data for GUS was available from the COSMOS trial.

ACR: American College of Rheumatology; ACR20/50/70: at least a 20/50/70% improvement in ACR response; bio-n: biologic disease-modifying anti-rheumatic drug-naïve; BMI: body mass index; BKZ: bimekizumab; BSA: body surface area; CI: confidence interval; csDMARD: conventional synthetic disease-modifying anti-rheumatic drug; EMA: European Medicines Agency; ESS: effective sample size; GUS: guselkumab; HAQ-DI: Health Assessment Questionnaire-Disability Index; IL: interleukin; IPD: individual patient data; MAIC: matching adjusted indirect comparison; MDA: minimal disease activity; MTX: methotrexate; NICE DSU TSD 18: National Institute for Health and Care Excellence Decision Support Unit Technical Support Document 18; NMA: network meta-analysis; NRI: non-responder imputation; OR: odds ratio; PsA: psoriatic arthritis; Q4W: every 4 weeks; Q8W: every 8 weeks; SD: standard deviation; SJC: swollen joint count; TJC: tender joint count; TNFi-exp: tumor necrosis factor inhibitor-experienced; VAS: visual analogue score; Unadj: unadjusted.

Figure 2 Matching-adjusted odds ratio comparison of BKZ vs GUS at Week 52 (NRI)

A) BKZ 160 mg Q4W vs GUS 100 mg Q4W in bio-n patients with PsA. B) BKZ 160 mg Q4W vs GUS 100 mg Q8W in bio-n patients with PsA. C) BKZ 160 mg Q4W vs GUS 100 mg Q8W in TNFi-exp patients with PsA. *Indicates statistical significance. Figures show a logarithmic scale. No comparison for BKZ vs GUS Q4W in TNFi-exp patients due to the lack of reported outcomes for TNFi-exp patients using GUS Q4W.

Figure 3 Matching-adjusted response rates of BKZ vs GUS in patients with active PsA at Week 52 (NRI)

A) BKZ 160 mg Q4W vs GUS 100 mg Q4W in bio-n patients with PsA. B) BKZ 160 mg Q4W vs GUS 100 mg Q8W in bio-n patients with PsA. C) BKZ 160 mg Q4W vs GUS 100 mg Q8W in TNFi-exp patients with PsA. *Indicates statistical significance. No comparison for BKZ vs GUS Q4W in TNFi-exp patients due to the lack of reported outcomes for TNFi-exp patients using GUS Q4W.
